

ENERCO P-10/2 Sleeper Changing Device

ENERCO P-10 is designed for changing the sleepers on track. The excavator should be equipped with Tilt Rotator to which the device is fitted with a quick coupling. This enables the sleepers easy and quick handling. Forward the excavator needs to have enough power takeouts to the hydraulic and connection to the magnetic valve.

The sleeper changing devices functions are:

- grabbing the sleeper
- pulling the sleeper out
- pushing the sleeper in

In case that the excavator is not equipped with Tilt Rotator the sleeper changing device can be modified to make limited turns near the fitting to the excavator. The jaws of the grabbing device can be changed suitable for the concrete sleepers. The standard version of P-10 does not lift the rail. Under the frame is guidance plates to the rails.
